QUERYING A DISTRIBUTION

- All variables: \mathcal{X} , evidence variables: \mathbf{E}
- **Probability query**
 - $P(\mathbf{Y} | \mathbf{e})$
- **MAP query**
 - $\mathbf{W} = \mathcal{X} \setminus \mathbf{E}$ (i.e., all the non-evidence variables)
 - $\text{MAP} | \mathbf{e} = \text{argmax}_{\mathbf{w}} P(\mathbf{w}, \mathbf{e})$
- **Marginal MAP query**
 - $\text{MAP}(\mathbf{Y} | \mathbf{e}) = \text{argmax}_{\mathbf{y}} P(\mathbf{y} | \mathbf{e})$
 - Let $\mathbf{Z} = \mathcal{X} \setminus \mathbf{E} \cup \mathbf{Y}$
 - $\text{MAP}(\mathbf{Y} | \mathbf{e}) = \text{argmax}_{\mathbf{y}} \sum_{\mathbf{z}} P(\mathbf{z}, \mathbf{y} | \mathbf{e})$

VARIABLE ELIMINATION FOR MAP

- Variable elimination works by multiplying and summing
- It's also called *sum-product* algorithm
- We can use the same technique for MAP, if we replace the sum operator with a max operator
- The algorithm is called *max-product*
- A few differences
 - Sum is replaced with max
 - All variables (except evidence) are eliminated
 - We need to trace back our steps to find the MAP assignment

EXAMPLES

- Two variables
- Student network
- Markov network

TWO VARIABLES

- Network
 - $A \rightarrow B$
- Parameters
 - $P(A) = [0.4; 0.6]$
 - $P(B | A=t) = [0.8; 0.2]$
 - $P(B | A=f) = [0.3; 0.7]$
- MAP ?
- MAP | $A=t$?
- MAP | $B=t$?

MAP ON THE STUDENT NETWORK

1. MAP ?

2. MAP | $G=g^1$?

WHAT IF MAP IS NOT UNIQUE?

- Network
 - $A \rightarrow B$
- Parameters – I
 - $P(A) = [0.5; 0.5]$
 - $P(B | A=t) = [0.4; 0.6]$
 - $P(B | A=f) = [0.6; 0.4]$
- Parameters – II
 - $P(A) = [0.4; 0.6]$
 - $P(B | A=t) = [0.25; 0.75]$
 - $P(B | A=f) = [0.5; 0.5]$

MAP ON A MARKOV NETWORK

A	B	$\phi(A,B)$
T	T	5
T	F	1
F	T	1
F	F	5

A	$\phi(A)$
T	2
F	1

B	$\phi(B)$
T	1
F	4

A	C	$\phi(A,C)$
T	T	6
T	F	1
F	T	1
F	F	6

C	$\phi(C)$
T	1
F	8

B	C	$\phi(B,C)$
T	T	1
T	F	10
F	T	10
F	F	1

COMPLEXITY

- All the arguments from the sum-product algorithm carry over
- Same variable ordering heuristics can be applied
- Message passing on a junction-tree structure can be done

MARGINAL MAP

- **Marginal MAP query**

- $\text{MAP}(\mathbf{Y} | \mathbf{e}) = \text{argmax}_{\mathbf{y}} P(\mathbf{y} | \mathbf{e})$
- Let $\mathbf{Z} = \mathcal{X} \setminus \mathbf{E} \cup \mathbf{Y}$
- $\text{MAP}(\mathbf{Y} | \mathbf{e}) = \text{argmax}_{\mathbf{y}} \sum_{\mathbf{z}} P(\mathbf{z}, \mathbf{y} | \mathbf{e})$

- We need to sum out \mathbf{Z}

- Max-sum-product algorithm

- First, eliminate \mathbf{Z} using sum-product algorithm
- Then, find MAP for \mathbf{Y} using max-product algorithm

- Unfortunately, max and sum cannot be interleaved

- The variables are partitioned into three disjoint sets: \mathbf{E} , \mathbf{Z} , \mathbf{Y}

- This partitioning limits which orders we can choose, as we can order only within \mathbf{Z} and within \mathbf{Y}
